

Running MemSoft with Windows 7 or Windows Vista

Here is all you need to do:

- Download and 'Save' the MemSoft install program to the desktop of your computer from <http://www.memsoft.com/download.asp> .
- Install MemSoft by right-clicking on the icon for the program and select '**Run as administrator**'. It should be near the top of the menu.
- Go ahead and go through the install and just follow what it says.
- After it is done installing, there should be '**Memsoft INSTRUCTOR**' icon on your desktop. Right-click on it and select '**Properties**' at the bottom of that menu.
- When the new window opens up, select the 'Shortcut' Tab, and then click on the '**Advanced**' button.
- That will bring up a window that has a box for '**Run as administrator**'. Make sure that box is checked (check it if it isn't), and then select OK (it should look like the screen below)
- Select OK one more time to save the changes.

You should now be setup to run MemSoft.

You can download and run the monthly products update any time after you start up MemSoft for the first time after the Vista update.

This is a picture of the screen you that needs to be updated in the steps above:
